(54) Title: NOVEL PYRAZOLE ANALOGS ACTING ON CANNABINOID RECEPTORS

(57) Abstract: One aspect of the invention is concerned with cannabimimetic pyrazole analogs. Another aspect of the invention is concerned with new and improved pyrazole analogs having high affinities and/or selectivities for the GB 1 cannabinoid receptor. A further aspect of the invention is concerned with pharmaceutical preparations employing the inventive analogs and methods of administering therapeutically effective amounts of the inventive analogs to provide a physiological effect.

NOVEL PYRAZOLE ANALOGS ACTING ON CANNABINOID RECEPTORS

Field of the Invention

The present invention relates generally to biologically active pyrazole analogs capable of interacting with the CB1 and/or the CB2 cannabinoid receptors. One aspect of the invention is concerned with new and improved pyrazole analogs acting as antagonists for the CB1 and/or the CB2 receptors. Another aspect of the invention is concerned with new and improved pyrazole analogs having selectivity for the CB1 or CB2 cannabinoid receptor. Still other aspects of the invention are concerned with pharmaceutical preparations employing the inventive analogs and methods of administering therapeutically effective amounts of the inventive analogs to provide a physiological effect.

Background of the Invention

The classical cannabinoid Δ^9-Tetrahydrocannabinol (Δ^9-THC) is the major active constituent extracted from Cannabis sativa. The effects of such cannabinoids are due to an interaction with specific high-affinity receptors. Presently, two cannabinoid receptors have been characterized: CB1, a central receptor found in the mammalian brain and a number of other sites in peripheral tissues; and CB2, a peripheral receptor found principally in cells related to the immune system. The CB1 receptor is believed to mediate the psychoactive properties associated with classical cannabinoids. Characterization of these receptors has been made possible by the development of specific synthetic ligands such as the agonists WIN 55212-2 and CP 55,940.

In addition to acting at the cannabinoid receptors, cannabinoids such as Δ^9-THC also affect cellular membranes, thereby producing undesirable side effects such as drowsiness, impairment of monoamine oxidase function and impairment of non-receptor mediated brain function. The addictive and psychotropic properties of some cannabinoids also limit their therapeutic value.

U.S. Patent No. 6,028,084 describes some pyrazole derivatives alleged to have binding affinity for the central cannabinoid receptor. International Publication Number WO 01/29007A1 also describes some pyrazole derivatives having binding affinity for cannabinoid receptors.

The pharmacological effects of cannabinoids pertain to a variety of areas such as the central nervous system, the cardiovascular system, the immune system and/or endocrine system. Compounds possessing an affinity for the CB1 and/or the CB2 cannabinoid receptors are useful as agents: acting on the central nervous system and in a variety of other roles.

Summary of the Invention

Briefly stated, one aspect of the invention is concerned with new and improved cannabimimetic (cannabinoid like) pyrazole analogs. The inventive cannabimimetic pyrazole ligands of this aspect can be represented by general formula I:

The inventive compounds include any and all isomers and steroisomers. In general, the compositions of the invention may be alternately formulated to comprise, consist of, or consist essentially of, any appropriate components herein disclosed. The compositions of the invention may additionally, or alternatively, be formulated so as to be devoid, or substantially free, of any components, materials, ingredients, adjuvants or species used in the prior art compositions or that are otherwise not necessary to the achievement of the function and/or objectives of the present invention.

Unless otherwise specifically defined, "acyl" refers to the general formula –C(O)alkyl.

Unless otherwise specifically defined, "acyloxy" refers to the general formula –O–acyl.

Unless otherwise specifically defined, "alcohol" refers to the general formula alkyl–OH and includes primary, secondary and tertiary variations.

Unless otherwise specifically defined, "alkyl" or "lower alkyl" refers to a linear, branched or cyclic alkyl group having from 1 to about 16 carbon atoms including, for example, methyl, ethyl, propyl, butyl, hexyl, octyl, isopropyl, isobutyl, tert-butyl, cyclopropyl, cyclohexyl, cyclooctyl, vinyl and allyl. The alkyl group can be saturated or unsaturated. The alkyl group can be unsubstituted, singly substituted or, if possible, multiply substituted, with substituent groups in any possible position. Unless otherwise specifically limited, a cyclic alkyl group includes monocyclic,

bicyclic, tricyclic, tetracyclic and polycyclic rings, for example norbornyl, adamantyl and related terpenes.

Unless otherwise specifically defined, "alkoxy" refers to the general formula –O–alkyl.

Unless otherwise specifically defined, "alkylmercapto" refers to the general formula –S–alkyl.

Unless otherwise specifically defined, "alkylamino" refers to the general formula –(NH)–alkyl.

Unless otherwise specifically defined, "di-alkylamino" refers to the general formula $-N-(alkyl)_2$. Unless otherwise specifically limited di-alkylamino includes cyclic amine compounds such as piperidine and morpholine.

Unless otherwise specifically defined, an aromatic ring is an unsaturated ring structure having about 5 to about 7 ring members and including only carbon as ring atoms. The aromatic ring structure can be unsubstituted, singly substituted or, if possible, multiply substituted, with substituent groups in any possible position.

Unless otherwise specifically defined, "aryl" refers to an aromatic ring system that includes only carbon as ring atoms, for example phenyl, biphenyl or napthyl. The aryl group can be unsubstituted, singly substituted or, if possible, multiply substituted, with substituent groups in any possible position.

Unless otherwise specifically defined, "aroyl" refers to the general formula –C(=O)–aryl.

Unless otherwise specifically defined, a bicyclic ring structure comprises 2 fused rings that include only carbon as ring atoms. The bicyclic ring structure can be saturated or unsaturated. The bicyclic ring structure can be unsubstituted, singly substituted or, if possible, multiply substituted, with substituent groups in any possible position. The individual rings may or may not be of the same type. Examples of bicyclic ring structures include naphthalene and bicyclooctane.

Unless otherwise specifically defined, a carbocyclic ring is a non-aromatic ring structure, saturated or unsaturated, having about 3 to about 8 ring members that includes only carbon as ring atoms, for example, benzene or cyclohexane. The carbocyclic ring can be unsubstituted, singly substituted or, if possible, multiply substituted, with substituent groups in any possible position.

Unless otherwise specifically defined, "halogen" refers to an atom selected from fluorine, chlorine, bromine and iodine.

Unless otherwise specifically defined, a heteroaromatic ring is an unsaturated ring structure having about 5 to about 8 ring members independently selected from carbon atoms and one or more heteroatoms, including oxygen, nitrogen and/or sulfur, for example, pyridine, furan, quinoline, and their derivatives. The heteroaromatic ring can be unsubstituted, singly substituted or, if possible, multiply substituted, with substituent groups in any possible position.

Unless otherwise specifically defined, a heterobicyclic ring structure comprises 2 fused rings having ring members independently selected from carbon and one or more heteroatoms, including oxygen, nitrogen and/or sulfur. The heterobicyclic ring structure is typically unsaturated. The heterobicyclic ring can be unsubstituted, singly substituted or, if possible, multiply substituted, with substituent groups in any possible position. The individual rings may or may not be of the same type. Examples of heterobicyclic ring structures include isobenzofuran and indole.

Unless otherwise specifically defined, a heterocyclic ring is a saturated ring structure having about 3 to about 8 ring members independently selected from carbon atoms and one or more heteroatoms, including oxygen, nitrogen and/or sulfur; for example, piperidine, morpholine, piperazine, pyrrolidine, thiomorpholine, and their derivatives. The heterocyclic ring can be unsubstituted, singly substituted or, if possible, multiply substituted, with substituent groups in any possible position.

Unless otherwise specifically defined, a heterotricyclic ring structure comprises 3 fused rings having ring members independently selected from carbon and one or more heteroatoms, including oxygen, nitrogen and/or sulfur. The heterotricyclic ring structure is typically unsaturated. The heterotricyclic ring structure can be unsubstituted, singly substituted or, if possible, multiply substituted, with substituent groups in any possible position. The individual rings may or may not be of the same type. Examples of heterotricyclic ring structures include carbazole, phenanthroline and phenazine.

Unless otherwise specifically defined, a heteropolycyclic ring structure comprises more than 3 fused rings having ring members independently selected from carbon and one or more heteroatoms, including oxygen, nitrogen and/or sulfur. The heteropolycyclic ring structure is typically unsaturated. The heteropolycyclic ring

structure can be unsubstituted, singly substituted or, if possible, multiply substituted, with substituent groups in any possible position. The individual rings may or may not be of the same type. Examples of heteropolycyclic ring structures include azaadamantine, tropane and homotroapane.

Unless otherwise specifically defined, the term "phenacyl" refers to the general formula –phenyl–acyl.

Unless otherwise specifically defined, a polycyclic ring structure comprises more than 3 fused rings and includes carbon as ring atoms. The polycyclic ring structure can be saturated or unsaturated. The polycyclic ring structure can be unsubstituted, singly substituted or, if possible, multiply substituted, with substituent groups in any possible position. The individual rings may or may not be of the same type. Examples of polycyclic ring structures include adamantine, bicyclooctane, norbornane and bicyclononanes.

Unless otherwise specifically defined, a spirocycle refers to a ring system wherein a single atom is the only common member of two rings. A spirocycle can comprise a saturated carbocyclic ring comprising about 3 to about 8 ring members, a heterocyclic ring comprising about 3 to about 8 ring atoms wherein up to about 3 ring atoms may be N, S, or O or a combination thereof.

Unless otherwise specifically defined, a tricyclic ring structure comprises 3 fused rings and includes carbon as ring atoms. The tricyclic ring structure can be saturated or unsaturated. The tricyclic ring structure can be unsubstituted, singly substituted or, if possible, multiply substituted, with substituent groups in any possible position. and may be substituted or unsubstituted. The individual rings may or may not be of the same type. Examples of tricyclic ring structures include fluorene and anthracene.

Substituent groups for the above moieties useful in the invention are those groups that do not significantly diminish the biological activity of the inventive compound. Substituent groups that do not significantly diminish the biological activity of the inventive compound include, for example, H, halogen, N_3, NCS, CN, NO_2, NX_1X_2, OX_3, OAc, O-acyl, O-aroyl, NH-acyl, NH-aroyl, NHCOalkyl, CHO, CF_3, $COOX_3$, SO_3H, PO_3H_2, $SO_2NX_1X_2$, $CONX_1X_2$, alkyl, alcohol, alkoxy, alkylmercapto, alkylamino, di-alkylamino, sulfonamide, thioalkoxy or methylene dioxy when the substituted structure has two adjacent carbon atoms, wherein X_1 and X_2 each

independently comprise H or alkyl, or X_1 and X_2 together comprise part of a heterocyclic ring having about 4 to about 7 ring members and optionally one additional heteroatom selected from O, N or S, or X_1 and X2 together comprise part of an imide ring having about 5 to about 6 members and X_3 comprises H, alkyl, hydroxyloweralkyl, or alkyl-NX_1X_2. Unless otherwise specifically limited a substituent group may be in any possible position.

Some of the inventive compounds showed a high affinity for at least one of the cannabinoid receptors. Thus, an aspect of the invention is use of at least one of the inventive compounds to interact with cannabinoid receptors.

Some of the novel pyrazole derivatives show selectivity for the CB1 cannabinoid receptor. These inventive CB1 selective analogs are able to interact with the CB1 receptor without affecting the peripheral (CB2) receptor to the same degree. Therefore, still another aspect of the invention is use of at least one of the inventive compounds to preferentially interact with the CB1 receptor.

Additionally, known cannabimimetic pyrazole ligands generally have long *in vivo* half-lives and are more lipophilic than desired for optimal *in vivo* activity. Some of the novel pyrazole analogs described herein are less lipophilic than known cannabimimetic pyrazole ligands and have shorter *in vivo* half-lives then known pyrazole analogs, providing the compounds of this embodiment with a favorable therapeutic profile. Therefore, yet another aspect of the invention is a cannabimimetic pyrazole analog that is less lipophilic than known cannabimimetic pyrazole analogs.

Some of the novel pyrazole analogs described herein are CB1 cannabinoid receptor antagonists that prevent binding of endogenous agonists to the cannabinoid receptors and thereby block the biological actions of such endogenous agonists. Therefore, a further aspect of the invention is use of at least one of the inventive compounds to prevent binding of a cannabinoid agonist to the CB1 cannabinoid receptor.

The inventive pyrazole analogs described herein, and physiologically acceptable salts thereof, have pharmacological properties when administered in therapeutically effective amounts for providing a physiological effect useful to treat marijuana abuse, obesity, schizophrenia, epilepsy, stress, memory disorders, migraine, vomiting, thymic disorders, dyskinesia, kinetic disorder, anxiety disorders,

psychotic disorders, cognitive disorders, appetite disorders, mood disorders, delirious disorders, neuropathies, Parkinson's disease, Alzheimers disease, depression, psychosomatic-induced disease, as well as for alcohol, opioid, nicotine and cocaine addiction, etc. Additionally, these analogs can be used in cancer chemotherapy. Thus, another aspect of the invention is the administration of a therapeutically effective amount of an inventive compound, or a physiologically acceptable salt thereof, to an individual or animal to provide a physiological effect.

A better understanding of the invention will be obtained from the following detailed description of the article and the desired features, properties, characteristics, and the relation of the elements as well as the process steps, one with respect to each of the others, as set forth and exemplified in the description and illustrative embodiments.

Brief Description of the Drawings

Figure 1 is a graph of a dose vs. response curve for inventive compound 5.

Description of Some Preferred Embodiments

As used herein a "therapeutically effective amount" of a compound, is the quantity of a compound which, when administered to an individual or animal, results in a sufficiently high level of that compound in the individual or animal to cause a physiological response. The inventive compounds described herein, and physiologically acceptable salts thereof, have pharmacological properties when administered in therapeutically effective amounts for providing a physiological response useful to treat marijuana abuse, obesity, schizophrenia, epilepsy, stress, memory disorders, migraine, vomiting, thymic disorders, dyskinesia, kinetic disorder, anxiety disorders, psychotic disorders, cognitive disorders, appetite disorders, mood disorders, delirious disorders, neuropathies, Parkinson's disease, Alzheimers disease, depression, psychosomatic-induced disease, as well as for alcohol, opioid, nicotine and cocaine addiction, etc. Additionally, these analogs can be useful in cancer chemotherapy. Typically, a "therapeutically effective amount" of an inventive compound is believed to range from about 10 mg/day to about 1,000 mg/day.

As used herein, an "individual" refers to a human. An "animal" refers to, for example, veterinary animals, such as dogs, cats, horses and the like, and farm animals, such as cows, pigs and the like.

The compound of the present invention can be administered by a variety of known methods, including orally, rectally, or by parenteral routes (e.g., intramuscular, intravenous, subcutaneous, nasal or topical). The form in which the compounds are administered will be determined by the route of administration. Such forms include, but are not limited to, capsular and tablet formulations (for oral and rectal administration), liquid formulations (for oral, intravenous, intramuscular, subcutaneous, ocular, intranasal, inhalation-based and transdermal administration) and slow releasing microcarriers (for rectal, intramuscular or intravenous administration). The formulations can also contain a physiologically acceptable vehicle and optional adjuvants, flavorings, colorants and preservatives. Suitable physiologically acceptable vehicles include, for example, saline, sterile water, Ringer's solution and isotonic sodium chloride solutions. The specific dosage level of active ingredient will depend upon a number of factors, including, for example, biological activity of the particular preparation, age, body weight, sex and general health of the individual being treated.

The following examples are given for purposes of illustration only in order that the present invention may be more fully understood. These examples are not intended to limit in any way the scope of the invention unless otherwise specifically indicated.

Examples:

A number of inventive cannabimimetic pyrazole derivatives were prepared. Table 1 illustrates some prepared CB1 selective pyrazole analogs (compounds 1-29). CB1 selective pyrazole analogs comprised compounds 1-6.

Some of the inventive analogs were tested for CB2 receptor binding affinity and for CB1 receptor affinity (to determine selectivity). As used herein, "binding affinity" is represented by the K_i value which is the inhibition constant correlated with the concentration of an analog required to occupy the 50% of the total number (Bmax) of the receptors. The lower the K_i value the higher the binding affinity. As used herein an analog is said to have "binding selectivity" if it has higher binding affinity for one receptor compared to the other receptor; e.g. a cannabinoid analog which has a K_i of 0.1 nM for CB1 and 10 nM for CB2, is 100 times more selective for the CB1 receptor.

For the CB1 receptor binding studies, membranes were prepared from rat forebrain membranes according to the procedure of P.R. Dodd et al, A Rapid Method for Preparing Synaptosomes: Comparison with Alternative Procedures, Brain Res., 107 - 118 (1981). The binding of the novel analogues to the CB1 cannabinoid receptor was assessed as described in W.A. Devane et al, Determination and Characterization of a Cannabinoid Receptor in a Rat Brain, Mol. Pharmacol., 34, 605 - 613 (1988) and A. Charalambous et al, 5'-azido Δ^8-THC: A Novel Photoaffinity Label for the Cannabinoid Receptor, J. Med. Chem., 35, 3076 - 3079 (1992) with the following changes. The above articles are incorporated by reference herein.

Membranes, previously frozen at -80°C, were thawed on ice. To the stirred suspension was added three volumes of TME (25 mM Tris-HCl buffer, 5 mM $MgCl_2$ and 1 mM EDTA) at a pH 7.4. The suspension was incubated at 4°C for 30 min. At the end of the incubation, the membranes were pelleted and washed three times with TME.

The treated membranes were subsequently used in the binding assay described below. Approximately 30 µg of membranes were incubated in silanized 96-well microtiter plate with TME containing 0.1% essentially fatty acid-free bovine serum albumin (BSA), 0.8 nM [^{3}H] CP-55,940, and various concentrations of test materials in a final volume of 200 µL. The assays were incubated for 1 hour at 30 °C and then immediately filtered using Packard Filtermate 196 harvester and Whatman GF/C filterplates and washed with wash buffer (TME) containing 0.5% BSA. Radioactivity was detected using MicroScint 20 scintillation cocktail added directly to the dried filterplates, and the filterplates were counted using a Packard

Instruments Top-Count. Nonspecific binding was assessed using 100 nM CP-55,940. Data collected from three independent experiments performed with duplicate determinations was normalized between 100% and 0% specific binding for [^{3}H] CP-55,940, determined using buffer and 100 nM CP-55,940. The normalized data was analyzed using a 4-parameter nonlinear logistic equation to yield IC_{50} values. Data from at least two independent experiments performed in duplicate was used to calculate IC_{50} values which were converted to K_i values using the assumptions of Cheng et al, Relationship Between the Inhibition Constant (K_i) and the concentration of Inhibitor which causes 50% Inhibition (IC_{50}) of an Enzymatic Reaction, Biochem. Pharmacol., 22, 3099-3102, (1973), which is incorporated by reference herein.

For the CB2 receptor binding studies, membranes were prepared from frozen mouse spleen essentially according to the procedure of P.R. Dodd et al, A Rapid Method for Preparing Synaptosomes: Comparison with Alternative Procedures, Brain Res., 226, 107 - 118 (1981) which is incorporated by reference herein. Silanized centrifuge tubes were used throughout to minimize receptor loss due to adsorption. The CB2 binding assay was conducted in the same manner as for the CB1 binding assay. The binding affinities (K_i) were also expressed in nanomoles (nM).

The CB1 cannabinoid receptor binding affinities (Ki) for the synthesized analogs range between 1.51 and 85.1. The CB2 cannabinoid receptor binding affinities (Ki) for the synthesized analogs range between 5.81 and 2312. The CB1 cannabinoid receptor selectivity for some of the synthesized analogs range from about 2 to about 452. The CB2 cannabinoid receptor selectivity for some of the synthesized analogs range from about 1 to about 4.

Preparation of compounds

General. Column chromatography was carried out by using active silica gel (230–400 mesh) available from Selecto Scientific of Suwanee, Georgia. Eluents were distilled before use. Solvents for reactions were dried or purified as required. Reactions were carried out under argon atmosphere unless otherwise noted. All of the reagents are available from Sigma-Aldrich Fine Chemicals of Milwaukee, Wisconsin and/or Lancaster Synthesis Inc. of Windham, New Hampshire.

Modification of the direct aromatic substitution at pyrazole position 1 can be

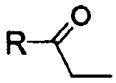
obtained by varying the respective starting hydrazine (i.e. 2,4-dichlorophenylhydrazine hydrochloride). Typically the starting hydrazine will having the general formula:

$$Ar—NHNH_2$$

Modification at pyrazole position 3 can be obtained by varying the respective starting material (i.e. 1-aminopiperidine). Typically the starting material will have the general formula:

$$RNH_2$$

Most of the compounds with substitutions at pyrazole position 5 can be obtained through method A, disclosed below, by varying the starting material (4'-bromopropiophenone shown). Typically the starting material will have the general formula:



The synthesis of most of the above starting materials is disclosed in the existing literature. See, for example, Synthesis, 4, 1999, 588-592. Synthesis of the starting materials not disclosed in the existing literature can be performed by a person skilled in the art using analogous chemistries and with no more than routine experimentation.

(a) LiHMDS, ether, then EtO_2CCO_2Et; (b) 2, 4-Dichlorophenylhydrazine hydrochloride, EtOH; (c) AcOH; (d) KOH/MeOH, HCl/H_2O; (e) $SOCl_2$, toluene; (f) 1-Aminopiperidine, Et_3N, CH_2Cl_2.

Lithium salt of ethyl 2,4-dioxo-3-methyl-4-(4-bromophenyl)butanoate. To a magnetically stirred solution of lithium bis(trimethylsilyl)amide (40 mL, 1.0 M solution in hexane, 40 mmol) in diethyl ether (120 mL) was added a solution of 4'-bromopropiophenone (8.52 g, 40 mmol) in diethyl ether (50 mL) at –78 °C. After the mixture was stirred at the same temperature for an additional 45 min, diethyl oxalate (6.4 mL, 47 mmol) was added to the mixture. The reaction mixture was allowed to warm to room temperature (RT) and stirred for 16 h. The precipitate was filtered, washed with diethyl ether, and dried under vacuum to afford the lithium salt.

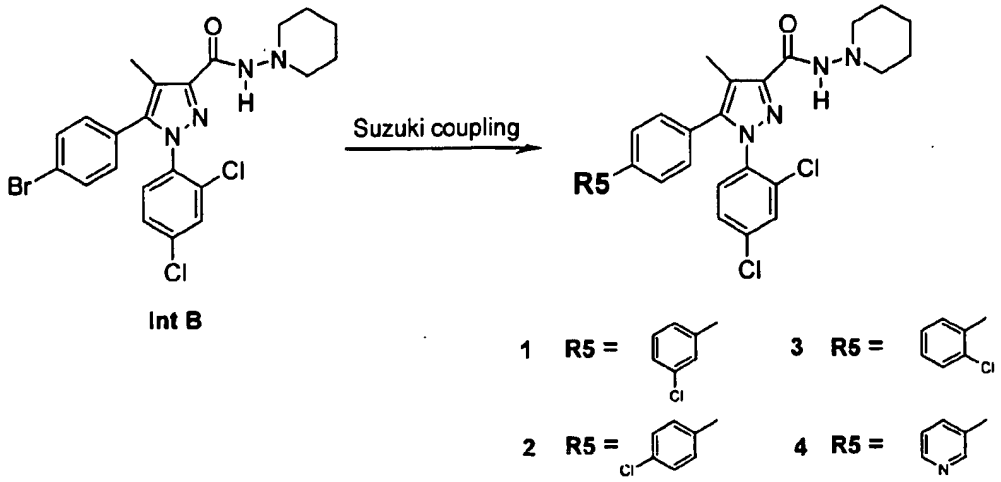
1-(2,4-Dichlorophenyl)-4-methyl-5-(4-bromophenyl)-1*H*-pyrazole-3-carboxylic acid, Ethyl Ester (Int. A). To a magnetically stirred solution of the above lithium salt (0.64g, 2.0 mmol) in 10 mL of ethanol was added 2,4-dichlorophenylhydrazine hydrochloride (0.47g, 2.2 mmol) at room temperature. The resulting mixture was stirred at room temperature for 20 h. The precipitate was

filtered, washed with ethanol and diethyl ether, and then dried under vacuum to give a light yellow solid. This solid was dissolved in acetic acid (7 mL) and heated under reflux for 24 h. The reaction mixture was poured into cold water and extracted multiple times with ethyl acetate. The combined extracts were washed with water, saturated aqueous sodium bicarbonate, and brine, dried over anhydrous sodium sulfate, filtered, and evaporated. Purification by flash column chromatography on silica gel gave the expected ester Int. A.

***N*-(Piperidin-1-yl)-5-(4-bromophenyl)-1-(2,4-dichlorophenyl)-4-methyl-1*H*-pyrazole-3-carboxamide (Int. B).** To a magnetically stirred solution of ester Int. A (0.625 g, 1.38 mmol) in methanol (7 mL) was added a solution of potassium hydroxide (0.155 g, 2.76 mmol) in methanol (5 mL). The mixture was heated under reflux for 3 h. The cooling reaction mixture was then poured into water (10 mL) and acidified with 10% hydrochloric acid. The precipitate was filtered, washed with water, and dried under vacuum to yield the corresponding acid as a solid.

A solution of the crude acid (0.585 g) and thionyl chloride (0.492 g, 4.14 mmol) in toluene (10 mL) was refluxed for 3 h. Solvent was evaporated under reduced pressure, and the residue was then redissolved in toluene (20 mL) and evaporated to yield the crude carboxylic chloride as a solid. A solution of the above carboxylic chloride (1.24 mmol) in dichloromethane (5 mL) was added dropwise to a solution of 1-aminopiperidine (0.21 mL, 1.92 mmol) in dichloromethane (5 mL) at 0 °C. After stirring at RT for 3 h, the reaction mixture was added with brine and extracted multiple times with dichloromethane. The combined extracts were washed with brine, dried over anhydrous sodium sulfate, filtered, and evaporated. Purification by flash column chromatography on silica gel gave the expected amide Int. B.

Method B: Alternate Route for 5-Substituted Analogs



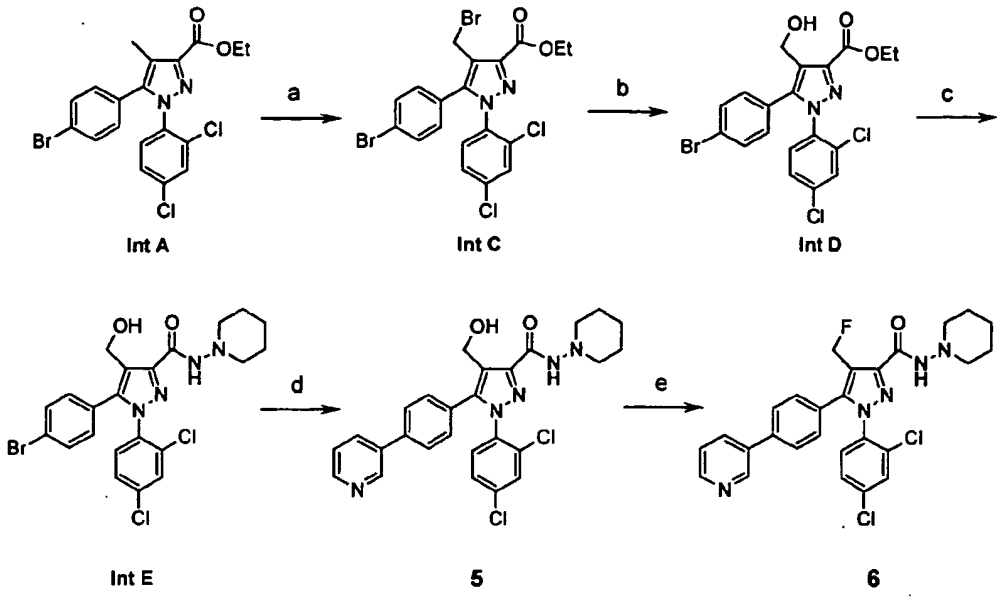
Some of the 5-substituted analogs can be prepared from Int. B via a Suzuki coupling reaction. The Suzuki coupling reaction allows synthesis of novel compounds in which the 5-phenyl ring is substituted with an aromatic ring or a heteroaromatic ring.

The coupling of a saturated heterocyclic ring (for example, morpholine) on the 5-phenyl ring can be obtained by Pd-catalyzed amination reaction (J. Org. Chem. 2000, 65, 1144-1157).

General procedure for the Suzuki Coupling reaction:

To a degassed solution of Int. B (100 mg, 0.197 mmol) and Pd $(PPh_3)_4$ (0.0085 mmol, 5 mol%) in 2 mL of DME was added 0.218 mmol of diethyl (3-pyridyl) borane or other aromatic boranic acid followed by 0.22 mmol of Na_2CO_3 in 1 mL of water. The resulting mixture was refluxed overnight. After reflux the mixture was diluted with CH_2Cl_2 and water. The organic phase was separated, and the water layer was extracted with CH_2Cl_2. The combined organic layer was washed with brine, dried over anhydrous sodium sulfate, filtered, and evaporated. Purification by flash column chromatography on silica gel gave the expected product.

Method C: Modification at Pyrazole Position 4



(a) NBS, AIBN, CCl_4; (b) $AgNO_3$, aq. acetone; (c) $AlCl_3$, 1-aminopiperidine, 1, 2-dichloroethane; (d) $Pd(PPh_3)_4$, diethyl (3-pyridyl) borane, DME, aq. $NaCO_3$; (e) DAST, CH_2Cl_2

These are obtained by functionalizing the 4-methyl group of the parent compound (Int. A). A variety of novel compounds having different substituents at pyrazole position 4 can be obtained. Similarly, modifications at pyrazole positions 3 and 5 can be obtained as shown under Method C.

Int. C. To a magnetically stirred solution of Int. A (2.02g, 4.44 mmol) in carbon tetrachloride (30 mL) was added *N*-bromosuccinimide (0.87 g, 4.89 mmol) and 2,2'-azobisisobutyronitrile (AIBN, 10 mg). The resulting mixture was refluxed for 3 h. After cooling to RT, the precipitate was filtered. The solvent was removed from the filtrate under reduced pressure to give the title product.

Int. D. To a magnetically stirred solution of silver nitrate (2.65g, 15.6 mmol) in 100 mL of 50% aqueous acetone at RT was added a suspension of Int. C (2.36g,

4.43 mmol) in 70% aqueous acetone. The mixture was stirred at 60 °C overnight. After cooling to RT, the insoluble material was filtered off and the filtrate was concentrated under vacuum to evaporate acetone. The residue was extracted with CH_2Cl_2. The organic layer was washed twice with water, dried over anhydrous sodium sulfate. The solvent was removed under reduced pressure. Purification by flash column chromatography on silica gel gave the title product.

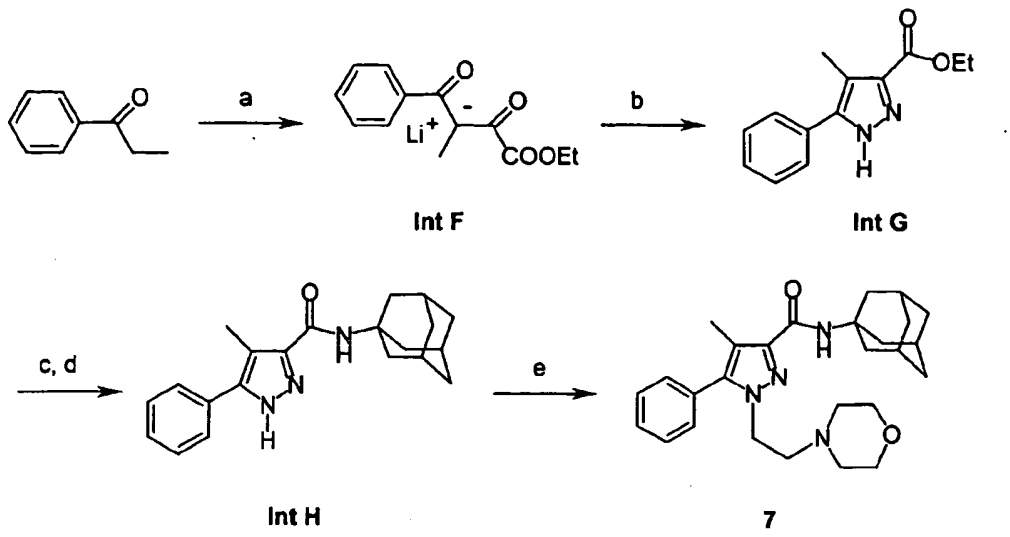
Int. E. To a magnetically stirred suspension of $AlCl_3$ (1.16g, 8.62 mmol) in 1,2-dichloroethane (20 mL) in an ice bath was added 1-aminopiperidine (2.0 mL, 18.0 mmol) in 1,2-dichloroethane (5 mL). The suspension was allowed to warm to RT. The solution of Int. D (2.03g, 4.43 mmol) in 1,2-dichloroethane (5 mL) was added into the above suspension and the mixture was stirred at RT for 2 h before quenching with a mixture of ice and H_2O. The mixture was stirred for a further 0.5 h and the resulting suspension was filtered through Celite and the organic phase separated. The aqueous phase was extracted multiple times with CH_2Cl_2 and the organic phases combined, washed with H_2O, brine, dried over anhydrous Na_2SO_4. The solvent was removed under reduced pressure. Purification by flash column chromatography on silica gel gave the title product.

Compound 5. Compound 5 was obtained from Int. E using a Suzuki coupling reaction as described above.

Compound 6. To a magnetically stirred solution of compound 5 (30 mg, 0.057 mmol) in 1.5 mL of CH_2Cl_2 at 0 °C was added DAST. After 1h, the reaction mixture was poured into saturated $NaHCO_3$ (2 mL) and was extracted with CH_2Cl_2. The organic phases combined, washed with H_2O, brine, dried over anhydrous Na_2SO_4. The solvent was removed under reduced pressure. Purification by flash column chromatography on silica gel gave the title product.

An alternate method for obtaining analogs with 1-alkyl substituents is described under Method D.

Method D: Modification at Pyrazole Position 1



(a) LiHMDS, ether, then EtO_2CCO_2Et; (b) Hydrazine hydrochloride, EtOH; (c) KOH/MeOH; HCl/H_2O (d) $CO(imid)_2$/DMF, 1-adamantanamine; (e) NaH/DMF, 4-(2-chloroethyl)morpholine.

Int. F. To a magnetically stirred solution of lithium bis(trimethylsilyl)amide (40 mL, 1.0 M solution in hexane, 40 mmol) in diethyl ether (120 mL) was added a solution of propiophenone (5.30 g, 40 mmol) in diethyl ether (50 mL) at –78 °C. After the mixture was stirred at the same temperature for additional 45 min, diethyl oxalate (6.4 mL, 47 mmol) was added to the mixture. The reaction mixture was allowed to warm to room temperature (RT) and stirred for 16 h. The precipitate was filtered, washed with diethyl ether, and dried under vacuum to afford the lithium salt (Int. F).

Int. G To a magnetically stirred solution of the above lithium salt (7.58 g, 32 mmol) in 250 mL of ethanol was added hydrazine hydrochloride (2.4 g, 35 mmol) at room temperature. The resulting mixture was stirred at room temperature for 20 h. After stirring the solvent was removed under reduced pressure and the mixture was added with brine and extracted multiple times with dichloromethane. The combined extracts were washed with brine, dried over anhydrous sodium sulfate, filtered, and evaporated. Purification by flash column chromatography on silica gel gave the expected ester (Int. G).

Int. H To a magnetically stirred solution of ester Int. G (5.88 g, 26 mmol) in methanol (150 mL) was added 10% aqueous potassium hydroxide (36 mL, 64 mmol). The resulting mixture was heated under reflux for 3 h. The cooling reaction mixture was then poured into water and acidified with 10% hydrochloric acid. The precipitate was filtered, washed with water, and dried under vacuum to yield the corresponding acid as a solid.

To a magnetically stirred solution of the above acid (4.02 g, 16 mmol) in 45 mL of DMF was added 1,1'-carbonyldiimidazole (2.8 g, 17 mmol) in one portion at RT and the mixture was stirred at 60 °C for 3 hrs. To the above mixture was added a mixture of 1-adamantanamine (2.6 g, 17 mmol) in 45 mL of DMF. The resulting mixture was heated at 60 °C overnight. DMF was removed under reduced pressure. Ethyl acetate was added to the residue, and the mixture was filtered to collect the solid.

Compound 7. To a magnetically stirred solution of Int. H (188 mg, 0.56 mmol) in 4 mL of DMF, was added NaH (60% dispersion in mineral oil, 35 mg, 0.87 mmol) at 0 °C and the mixture was stirred at RT for 3 hrs. After stirring, the reaction mixture was cooled to 0 °C and a solution of 4-(2-chloroethyl)morpholine (185 mg, 1.25 mmol) in 1 mL of DMF was added. The resulting mixture was heated at 60 °C for 3 hrs. After heating, brine was added to the mixture, which was subsequently extracted multiple times with dichloromethane. The combined extracts were washed with brine, dried over anhydrous sodium sulfate, filtered, and evaporated. Purification by flash column chromatography on silica gel gave the expected product.

11 rats were trained to press a lever five times to receive a 45 mg food pellet. The training continued over a time period of several weeks. After the training period all rats received drug treatments once per week. The specific rat receiving a drug treatment and the dosage given were each randomly varied. The treatments comprised administration of a vehicle control solution or various dosages of inventive compound 5 in combination with the vehicle control solution. All injections were given IP. Ten minutes after injection the rat was placed in proximity to the lever.

Figure 1 illustrates a mean (±SEM) number of lever presses in 30 min for treated animals. The overall suppression of food-reinforced lever pressing was statistically significant ($p<0.05$). Figure 1 illustrates a classic dose response curve wherein as the dose of drug (inventive compound 5) increases, lever pressing consistently decreases. Without wishing to be bound to any theory, applicants believe that inventive compound 5 antagonizes (blocks) the CB1 receptors, thereby suppressing appetite and leading to decreased lever pressing.

Those skilled in the art will recognize, or be able to ascertain with no more than routine experimentation, many equivalents to the specific embodiments of the invention disclosed herein. Such equivalents are intended to be encompassed by the scope of the invention.

X_1 and X_2 each independently comprise H or alkyl, or

X_1 and X_2 together comprise part of a heterocyclic ring having about 4 to about 7 ring members and optionally one additional heteroatom selected from O, N or S, or

X_1 and X2 together comprise part of an imide ring having about 5 to about 6 members,

X3 comprises H, alkyl, hydroxyloweralkyl, or alkyl-NX_1X_2,

n is an integer from 0 to about 6.

17. The compound of claim 1, and physiologically acceptable salts thereof, wherein R4 comprises $-CH_2-Q-(CH_2)_n-Z$,

Q comprises N, O, S, CH_3, SO_2 or OSO_2,

n is an integer from 0 to about 7, and

Z comprises a bicyclic ring, a heterobicyclic ring, a tricyclic ring, a heterotricyclic ring, a polycyclic ring or a heteropolycyclic ring.

18. The compound of claim 1, and physiologically acceptable salts thereof, wherein R4 comprises $-CH_2-Q-(CH_2)_n-Z$,

Q comprises N, O, S, CH_3, SO_2 or OSO_2,

n is an integer from 0 to about 7, and

Z comprises a carbocyclic ring having about 4 to about 7 ring members, a heterocyclic ring having about 4 to about 7 ring members, an aromatic ring having about 5 to about 7 ring members, a heteroaromatic ring having about 5 to about 7 ring members; or any above group substituted on at least one available ring atom by a lower-alkyl group; or any above group substituted on at least one available ring nitrogen atom by a benzyl group, a substituted benzyl group, an alkoxybenzyl group, a substituted alkoxybenzyl group, a benzhydryl group or a substituted benzhydryl group; and wherein the connecting point between the $-(CH_2)_n-$ group and the Z group can be any available ring carbon atom or any available ring nitrogen atom.

19. The compound of claim 1, and physiologically acceptable salts thereof, wherein R4 comprises $-CH_2-Q-(CH_2)_n-Z$,

Q comprises N, O, S, CH_3, SO_2 or OSO_2,

n is an integer from 0 to about 7, and

Z comprises 1-, 2- or 3-pyrrolidinyl, 1-, 2-, 3- or 4-piperidinyl, 2-, 3- or 4-morpholinyl, 2-, 3- or 4-thiomorpholinyl, 1-, 2- or 3-azetidinyl, 1- or 2-piperazinyl, 2- or 3-tetrahydrofuranyl; or any above group substituted on at least one available ring atom by a lower-alkyl group; or any above group substituted on at least one available ring nitrogen atom by a benzyl group, a substituted benzyl group, an alkoxybenzyl group, a substituted alkoxybenzyl group, a benzhydryl group or a substituted benzhydryl group; and wherein the connecting point between the $-(CH_2)_n-$ group and the Z group can be any available ring carbon atom or any available ring nitrogen atom.

20. The compound of claim 1, and physiologically acceptable salts thereof, wherein R4 comprises $-CH_2-Q-(CH_2)_n-Z$,

Q comprises N, O, S, CH_3, SO_2 or OSO_2,

n is an integer from 0 to about 7, and

Z comprises

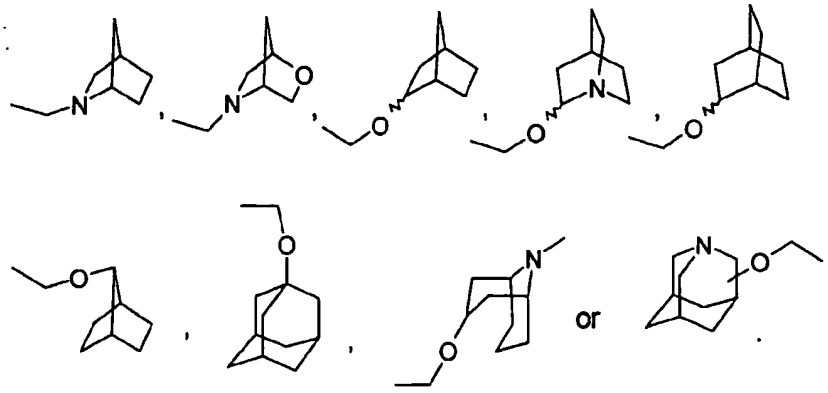
22. The compound of claim 1, and physiologically acceptable salts thereof, wherein R4 comprises $-CH_2-Q-(CH_2)_n-Z$,

Q comprises N, O, S, CH_3, SO_2 or OSO_2,

n is an integer from 0 to about 7, and

Z comprises



23. The compound of claim 1, and physiologically acceptable salts thereof, wherein R4 comprises $-T-(CH_2)_n-Z$,

n comprises an integer from 0 to about 7,

T comprises a carbocyclic ring having 3 to about 8 ring members, an unsaturated ring having 3 to about 8 carbon atoms as ring members, a heterocyclic ring having 3 to about 8 ring members, a heteroaromatic ring having 5 to about 8 ring members, a bicyclic ring, a heterobicyclic ring, a tricyclic ring, a heterotricyclic ring, a polycyclic ring or a heteropolycyclic ring, and

Z comprises H, halogen, N_3, NCS, CN, NO_2, NX_1X_2, OX_3, OAc, O-acyl, O-aroyl, $O(CH_2)_nOH$, $O(CH_2)_nNX_1X_2$, NH-acyl, NH-aroyl, CHO, CF_3, $COOX_3$, SO_3H, $SO_2NX_1X_2$, $CONX_1X_2$, alkoxy, alkylmercapto, alkylamino or di-alkylamino alkylsulfinyl, or alkylsulfonyl,

X_1 and X_2 each independently comprise H or alkyl, or

X_1 and X_2 together comprise part of a heterocyclic ring having about 4 to about 7 ring members and optionally one additional heteroatom selected from O, N or S, or

X_1 and X2 together comprise part of an imide ring having about 5 to about 6 members,

X_3 comprises H, alkyl, hydroxyloweralkyl, or alkyl-NX_1X_2

n is an integer from 0 to about 6.

24. The compound of claim 1, and physiologically acceptable salts thereof, wherein R4 comprises $-T-(CH_2)_n-Z$,

n comprises an integer from 0 to about 7,

T comprises a carbocyclic ring having 3 to about 8 ring members, an unsaturated ring having 3 to about 8 carbon atoms as ring members, a heterocyclic ring having 3 to about 8 ring members, a heteroaromatic ring having 5 to about 8 ring members, a bicyclic ring, a heterobicyclic ring, a tricyclic ring, a heterotricyclic ring, a polycyclic ring or a heteropolycyclic ring, and

Z comprises a carbocyclic ring having about 4 to about 7 ring members, a heterocyclic ring having about 4 to about 7 ring members, an aromatic ring having about 5 to about 7 ring members, a heteroaromatic ring having about 5 to about 7 ring members, a bicyclic ring, a heterobicyclic ring, a polycyclic ring, a heteropolycyclic ring; or any above group substituted on at least one available ring atom by a lower-alkyl group; or any above group substituted on at least one available ring nitrogen atom by a benzyl group, a substituted benzyl group, an alkoxybenzyl group, a substituted alkoxybenzyl group, a benzhydryl group or a substituted benzhydryl group; and wherein the connecting point between the $-(CH_2)_n-$ group and the Z group can be any available ring carbon atom or any available ring nitrogen atom.

25. The compound of claim 1, and physiologically acceptable salts thereof, wherein R4 comprises $-T-(CH_2)_n-Z$,

n comprises an integer from 0 to about 7,

T comprises a carbocyclic ring having 3 to about 8 ring members, an unsaturated ring having 3 to about 8 carbon atoms as ring members, a heterocyclic ring having 3 to about 8 ring members, a heteroaromatic ring having 5 to about 8 ring

members, a bicyclic ring, a heterobicyclic ring, a tricyclic ring, a heterotricyclic ring, a polycyclic ring or a heteropolycyclic ring, and

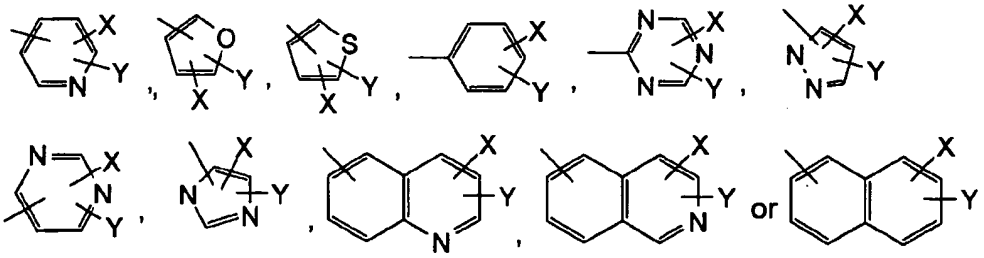
Z comprises 1-, 2- or 3-pyrrolidinyl, 1-, 2-, 3- or 4-piperidinyl, 2-, 3- or 4-morpholinyl, 2-, 3- or 4-thiomorpholinyl, 1-, 2- or 3-azetidinyl, 1- or 2-piperazinyl, 2- or 3-tetrahydrofuranyl; or any above group substituted on at least one available ring atom by a lower-alkyl group; or any above group substituted on at least one available ring nitrogen atom by a benzyl group, a substituted benzyl group, an alkoxybenzyl group, a substituted alkoxybenzyl group, a benzhydryl group or a substituted benzhydryl group; and wherein the connecting point between the $-(CH_2)_n-$ group and the Z group can be any available ring carbon atom or any available ring nitrogen atom.

26. The compound of claim 1, and physiologically acceptable salts thereof, wherein R4 comprises $-T-(CH_2)_n-Z$,

n comprises an integer from 0 to about 7,

T comprises a carbocyclic ring having 3 to about 8 ring members, an unsaturated ring having 3 to about 8 carbon atoms as ring members, a heterocyclic ring having 3 to about 8 ring members, a heteroaromatic ring having 5 to about 8 ring members, a bicyclic ring, a heterobicyclic ring, a tricyclic ring, a heterotricyclic ring, a polycyclic ring or a heteropolycyclic ring, and

Z comprises



wherein X and Y each independently comprise H, halogen, N_3, NCS, CN, NO_2, NX_1X_2, OX_3, OAc, O-acyl, O-aroyl, NH-acyl, NH-aroyl, alcohol, CHO, CF_3, $COOX_3$, SO_3H, $SO_2NX_1X_2$, $CONX_1X_2$, alkoxy, alkylmercapto,

alkylamino or di-alkylamino, alkylsulfinyl, alkylsulfonyl, or methylene dioxy when Z comprises a structure having two adjacent carbon atoms.

X_1 and X_2 each independently comprise H or alkyl, or

X_1 and X_2 together comprise part of a heterocyclic ring having about 4 to about 7 ring members and optionally one additional heteroatom selected from O, N or S, or

X_1 and X2 together comprise part of an imide ring having about 5 to about 6 members,

X_3 comprises H, alkyl, hydroxyloweralkyl, or alkyl-NX_1X_2.

27. The compound of claim 1, and physiologically acceptable salts thereof, wherein R4 comprises $-T-(CH_2)_n-Z$,

n comprises an integer from 0 to about 7,

T comprises a carbocyclic ring having 3 to about 8 ring members, an unsaturated ring having 3 to about 8 carbon atoms as ring members, a heterocyclic ring having 3 to about 8 ring members, a heteroaromatic ring having 5 to about 8 ring members, a bicyclic ring, a heterobicyclic ring, a tricyclic ring, a heterotricyclic ring, a polycyclic ring or a heteropolycyclic ring, and

Z comprises an unsaturated ring having 5 ring atoms and 0 to 2 independently selected heteroatoms as ring members fused to an unsaturated ring having 5 ring atoms and 0 to 2 independently selected heteroatoms as ring members, an unsaturated ring having 5 ring atoms and 0 to 2 independently selected heteroatoms as ring members fused to an unsaturated ring having 6 or 7 ring atoms and 0 to 3 independently selected heteroatoms as ring members or an unsaturated ring having 6 ring atoms and 0 to 3 independently selected heteroatoms as ring members fused to an unsaturated ring having 6 or 7 ring atoms and 0 to 3 independently selected heteroatoms as ring members.

28. The compound of claim 1, and physiologically acceptable salts thereof, wherein R4 comprises $-Ph-(CH_2)_n-Z$,

n comprises an integer from 0 to about 7, and

Z comprises H, halogen, N_3, NCS, CN, NO_2, NX_1X_2, OX_3, OAc, O-acyl, O-aroyl, $O(CH_2)_nOH$, $O(CH_2)_nNX_1X_2$, NH-acyl, NH-aroyl, CHO, CF_3, $COOX_3$, SO_3H, $SO_2NX_1X_2$, $CONX_1X_2$, alkoxy, alkylmercapto, alkylamino or di-alkylamino,

X_1 and X_2 each independently comprise H or alkyl, or

X_1 and X_2 together comprise part of a heterocyclic ring having about 4 to about 7 ring members and optionally one additional heteroatom selected from O, N or S, or

X_1 and X2 together comprise part of an imide ring having about 5 to about 6 members,

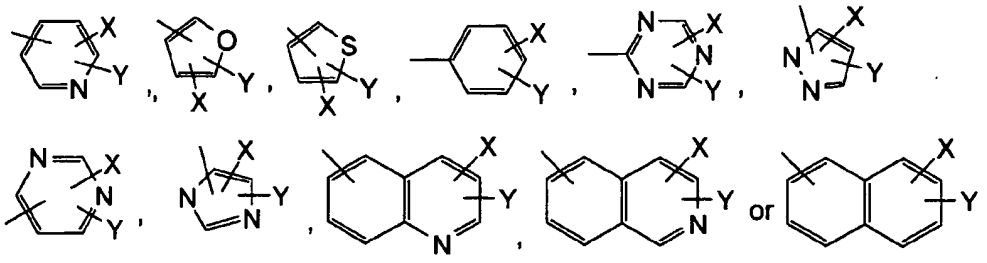
X_3 comprises H, alkyl, hydroxyloweralkyl, or alkyl-NX_1X_2,

n is an integer from 0 to about 6.

29. The compound of claim 1, and physiologically acceptable salts thereof, wherein R4 comprises $-Ph-(CH_2)_n-Z$,

n comprises an integer from 0 to about 7, and

Z comprises



wherein X and Y each independently comprise H, halogen, N_3, NCS, CN, NO_2, NX_1X_2, OX_3, OAc, O-acyl, O-aroyl, NH-acyl, NH-aroyl, CHO, CF_3, alcohol, $COOX_3$, SO_3H, $SO_2NX_1X_2$, $CONX_1X_2$, alkoxy, alkylmercapto, alkylamino or di-alkylamino, alkylsulfinyl, lower-alkylsulfonyl, or methylene dioxy when Z comprises a structure having two adjacent carbon atoms,

X_1 and X_2 each independently comprise H or alkyl, or

X_1 and X_2 together comprise part of a heterocyclic ring having about 4 to about 7 ring members and optionally one additional heteroatom selected from O, N or S, or

X_1 and X2 together comprise part of an imide ring having about 5 to about 6 members,

X_3 comprises H, alkyl, hydroxyloweralkyl, or alkyl-NX_1X_2.

30. The compound of claim 1, and physiologically acceptable salts thereof, wherein R4 comprises $-Ph-(CH_2)_n-Z$,

n comprises an integer from 0 to about 7, and

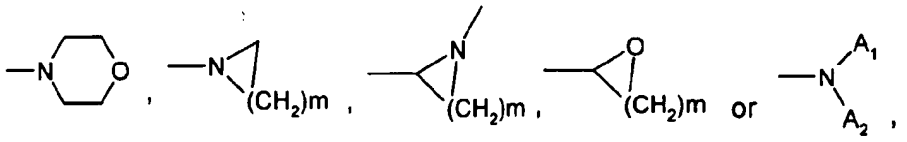
Z comprises  or ,

E comprises a C1 to about C4, linear or branched alkyl group, a phenyl group, a substituted phenyl group, a benzyl group or a substituted benzyl group.

31. The compound of claim 1, and physiologically acceptable salts thereof, wherein R4 comprises $-Ph-(CH_2)_n-Z$,

n comprises an integer from 0 to about 7, and

Z comprises



m is an integer from 1 to about 5, A_1 and A_2 each independently comprise a C1 to about C4 alkyl group, a phenyl group or a substituted phenyl group.

32. A pharmaceutical composition for an individual or animal comprising a therapeutically effective amount of the compound of any of claims 1 through 28 or a physiologically acceptable salt thereof.

33. A method of stimulating at least some cannabinoid receptors in an individual or animal comprising administering to the individual or animal a therapeutically effective amount of the compound of any of claims 1 through 28 or a physiologically acceptable salt thereof.

34. A method of selectively stimulating at least some CB1 cannabinoid receptors in an individual or animal comprising administering to the individual or animal a therapeutically effective amount of the compound of any of claims 1 through 28 or a physiologically acceptable salt thereof.

35. A method for the treatment of a disease in an animal or individual comprising administering to an individual or animal in need of such treatment a therapeutically effective amount of the compound of any of claims 1 through 28 or a physiologically acceptable salt thereof.

(54) Title: NOVEL PYRAZOLE ANALOGS ACTING ON CANNABINOID RECEPTORS

(57) Abstract: One aspect of the invention is concerned with cannabimimetic pyrazole analogs. Another aspect of the invention is concerned with new and improved pyrazole analogs having high affinities and/or selectivities for the GB 1 cannabinoid receptor. A further aspect of the invention is concerned with pharmaceutical preparations employing the inventive analogs and methods of administering therapeutically effective amounts of the inventive analogs to provide a physiological effect.

INTERNATIONAL SEARCH REPORT

International application No.
PCT/US02/27644

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:

2. ☒ Claims Nos.: 1-5 and 7-35
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:

Please See Extra Sheet.

3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.

2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.

3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:

4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

☐ The additional search fees were accompanied by the applicant's protest.

☐ No protest accompanied the payment of additional search fees.

BOX I. OBSERVATIONS WHERE CLAIMS WERE FOUND UNSEARCHABLE

2. Where no meaningful search could be carried out, specifically:

In these claims, the numerous variables and their voluminous, complex meanings and their seemingly endless permutations and combinations plus the intricate proviso section, make it virtually impossible to determine the full scope and complete meaning of the claimed subject matter. As presented, the claimed subject matter cannot be regarded as being a clear and concise description for which protection is sought and as such the listed claims do not comply with the requirements of PCT Article 6. Thus it is impossible to carry out a meaningful search on same. A search will be made on the first discernable invention of claim 6, which is compound 1 as found on page 27.
